## 1 Problem 4.2

Use separation of variable in *cartesian* coordinates to solve the infinite *cubical* well (or particle in a box):

$$V(x, y, z) = \begin{cases} 0, & \forall x, y, z \in [0, a] \\ \infty, & \forall x, y, z \notin [0, a] \end{cases}$$

- Find the stationary states, and the corresponding energies.
- Call the distinct energies  $E_1, E_2, \dots$  in order of increasing energy. Find  $E_1, E_2, E_3, E_4, E_5$  and  $E_6$ . Determine their degeneracies (that is, the number of different states that share the same energy).
- What is the degeneracy of  $E_{14}$ , and why is this case interesting?

## 2 Problem 4.3

Use

$$P_l^m(x) \equiv (1-x^2)^{|m|/2} \left( \frac{d}{dx} \right)^{|m|} P_l(x)$$

$$P_l(x) \equiv \frac{1}{2^l l!} \left( \frac{d}{dx} \right)^l (x^2-1)^l$$

$$Y_l^m(\theta, \phi) = \epsilon \sqrt{\frac{(2l+1)(l-|m|)!}{4\pi(l+|m|)!}} e^{im\phi} P_l^m(\cos[\theta])$$

to construct  $Y_0^0$  and  $Y_2^l$ . Check that they are normalized and orthogonal.

### 3 Problem 4.13

- Find  $\langle r \rangle$  and  $\langle r^2 \rangle$  for an electron in the ground state of hydrogen. Express your answers in terms of the Bohr radius.
- Find  $\langle x \rangle$  and  $\langle x^2 \rangle$  for an electron in the ground state of hydrogen. *Hint:* this requires no new integration-note that  $r^2 = x^2 + y^2 + z^2$ , and exploit the symmetry of the ground state.
- Find  $\langle x^2 \rangle$  in the state  $n = 2, l = 1, m = 1$ . *Warning:* This state is not symmetrical in  $x, y, z$ . Use  $x = r \sin \theta \cos \phi$ .

### 4 Problem 4.14

What is the *most probable* value of  $r$ , in the ground state of hydrogen? (The answer is not zero!) *Hint:* First you must figure out the probability that the electron would be found between  $r$  and  $r + dr$ .

### 5 Problem 4.23

In problem 4.3 you showed that

$$Y_2^l(\theta, \phi) = -\sqrt{\frac{15}{8\pi}} \sin \theta \cos \theta e^{i\phi}.$$

Apply the raising operator to find  $Y_2^2(\theta, \phi)$ . Use equation  $A_l^m = \hbar \sqrt{l(l+1) - m(m \pm 1)} = \hbar \sqrt{(l \mp m)(l \pm m + 1)}$  to get the normalization.
